## About

7+ years of research experience in physics simulation, geometry modeling, and applied and computational mathematics. My research interests are in applying mathematical solutions to innovate computer algorithms that solve real world problems.

**Geometric optimization:** Many geometry processing and deep learning tasks boil down to optimization problems, many of which are nonconvex. Mathematical insights can help discover the convex equivalent problems which comply with the fast and robust convex solvers.

**Physics modeling:** Physical phenomena like solids, fluids, friction, fracture are crucial in modeling and understanding the real world. Existing algorithms often have to choose between performance and accuracy. Mathematical theories can inspire novel discretization schemes that are both faster and better at conserving important physical quantities.

I am currently looking for the next position that starts in **January 2024**.
